doing mathematics discusses some ways mathematicians and mathematical physicists do their work and the subject matters they uncover and fashion the conventions they adopt the subject areas they delimit what they can prove and calculate about the physical world and the analogies they discover and employ all depend on the mathematics what will work out and what won't the cases studied include the central limit theorem of statistics the sound of the shape of a drum the connections between algebra and topology and the series of rigorous proofs of the stability of matter the many and varied solutions to the two dimensional ising model of ferromagnetism make sense as a whole when they are seen in an analogy developed by richard dedekind in the 1880s to algebraicize riemann's function theory by robert langlands program in number theory and representation theory and by the analogy between one dimensional quantum mechanics and two dimensional classical statistical mechanics in effect we begin to see an identity in a manifold presentation of profiles as the phenomenologists would say this second edition deepens the particular examples it describe the practical role of mathematical rigor it suggests what might be a mathematician's philosophy of mathematics and it shows how an ugly first proof or derivation embodies essential features only to be appreciated after many subsequent proofs natural scientists and mathematicians trade physical models and abstract objects remaking them to suit their needs discovering new roles for them as in the recent case of the painlevé transcendents the tracy widom distribution and toeplitz determinants and mathematics has provided the models and analogies the ordinary language for describing the everyday world the structure of cities or god's infinitude
